REPORT

 $\mathbf{B}\mathbf{Y}$

THE ORDINARY MANAGERS

OF THE

ROYAL EDINBURGH ASYLUM FOR THE INSANE.

Presented to the Annual General Meeting of the Corporation, held on Monday, 26th February 1877.

In reviewing the history of the Royal Edinburgh Asylum during the past year, the Managers are glad to be able to report that in general it has been a period of prosperity to the Institution under their charge.

The average daily number of Patients accommodated in both departments of the Asylum during the year was ... 740·240

The average during the year ending 31st December 1875

was 723·713

Shewing an increase of ... 16.527

Of this gross increase, four belong to the East House, and twelve to the West House.

The Managers beg to refer to the Report of Dr Clouston, the able and indefatigable Physician-Superintendent of the Asylum, for all information in regard to the Patients, the nature of their complaints, the treatment pursued, and the cures effected.

The accounts of the Treasurer's intromissions for the year 1876 are herewith submitted.

The Charge amounts to The Discharge amounts to	£43,332 41,225		$4\frac{1}{2}$ $1\frac{1}{2}$
And the Balance due by the Treasurer is	£2,107	6	3
The Ordinary Income during the year,	£32,751	17	3
The Ordinary Expenditure,	28,312	0	$9\frac{1}{2}$
Shewing a Surplus Revenue of	£4,439	16	$\frac{-1}{5\frac{1}{2}}$

During the year there was expended in additions to buildings, and in painting and furnishing the new apartments, the sum of £10,980 8s. 11d. The surplus revenue was applied in meeting pro tanto the above extraordinary expenditure, the deficit of £6,540 12s. $5\frac{1}{2}$ d. being provided for by new loans.

The total amount of Debt secured upon the property	of	the
Corporation at 31st December 1876 was £31,225	0	0
Deducting the Balance due by the Treasurer, 2,107	6	3
The Indebtedness at that date was £29,117	13	9
The Indebtedness at 31st December 1875, after		
deducting the balance then on hand, was 22,568	18	$11\frac{1}{2}$
£6,548 Less increase of Arrears during 1876, 8	14	$9\frac{1}{2}$
Less increase of Arrears during 1876, 8	2	4
Shewing an increase of Debt of £6,540 equivalent to the above deficit.	12	$5\frac{1}{2}$

The provisions of the Act of Parliament in regard to the progressive liquidation of the Statutory Debt have been complied with, by payment during the past year of Bonds amounting to £1763 9s., and the Statutory Debt has now been reduced from the original amount of £30,000 to £13,525. In consequence of the large amount of extraordinary expenditure during the year, the above payment to account of this debt could only be made out of money borrowed on the postponed security of the Asylum property.

During the year considerable progress has been made in the additions to the Asylum buildings, and in the reconstruction of large parts both of the Eastern and Western departments.

In the East House elegant suites of rooms for the accommodation of the ladies and gentlemen respectively have been added to the building; the apartments designed for the purposes of seclusion, which were at one time considered necessary in Asylums, have been altered or done away with, and two dining-rooms of a very handsome kind are being constructed. The new bed-rooms are completed, and have been for some time in use, and the dining-rooms will soon be ready for occupation.

In the West House the structural alterations referred to in former Reports have been nearly completed. For the prison-like cages which so long disfigured the north-east and south-east wings have been substituted light and airy apartments, with every modern comfort and convenience. The common dining-hall has been completed, and it is believed, that for spaciousness and elegance it may challenge comparison with any saloon of a similar kind in Scotland. The Managers regret that, owing to the internal reconstruction of the house not being completed, the Patients are not able regularly to use this apartment as a dining-room. It has, however, been sometimes made use of on festive occasions, and has been found admirably adapted for such purposes.

With the view of at once providing suitable employment for a number of the inmates, and supplying the wants of the house, a Bakehouse has been erected in connection with the Western department.

It is believed that the cost of the alterations and additions above referred to, with contingencies, will amount to not less than $\pounds 24,000 \ 0 \ 0$ Whereof there has been already expended ... $19,267 \ 2 \ 7$ Leaving still to be provided for ... $\pounds 4,732 \ 17 \ 5$

At 31st December 1873 the total amount of debt due by the Corporation was £21,800 16s. 8d.; and it is satisfactory to note, that notwithstanding the large expenditure upon the new works which has since taken place, amounting, as above, to £19,267 2s. 7d., the liabilities now amount to no more than £29,117 13s. 9d. It thus appears that during the last three years the property of the Corporation has been permanently improved by the amount of

£19,267 2s. 7d., while the debt has only increased £7,316 17s. 1d., the balance, amounting to £11,950 5s. 6d., having been wholly defrayed out of surplus ordinary income.

The Managers trust that they will be able, out of surplus ordinary income of the current year, to pay the amount still to be expended, without having to add farther to their debt.

The Managers have long felt that it would be a convenience to consolidate the debt of the Corporation, and they beg leave to request from the Corporation special powers to apply to Parliament for an act with this object in view. The Managers further propose to take advantage of the occasion of their being before Parliament at any rate, to apply for such other modifications and amendments on their Act of Incorporation as circumstances may seem to call for.

Looking to the probable continuance of the present high prices, and the rates of wages, the Managers regret that they cannot advise any reduction in the boards.

The Managers will conclude their remarks by quoting the following passages from the Official Report of Dr Mitchell, one of Her Majesty's Commissioners in Lunacy, on the occasion of his last visit to the Asylum, which took place on 30th and 31st ult., and 1st inst.:—

"It appears that this Asylum gives accommodation to a very large number of private patients. Many of these pay high rates of board, and they have comforts and advantages in return such as few Asylums supply. A large proportion of the private patients, however, pay low rates of board, and, in reference to them, it is felt that this Institution discharges a very humane and charitable function. They are most liberally treated, and to their history and habits a very kindly consideration is given. The same liberal dealing is extended to some patients who are actually paupers, but who belong socially to a class above that from which pauper lunatics are ordinarily drawn. In carrying out these benevolent objects, the Institution must frequently suffer a loss far beyond any possibility of recoupment from the small Charitable Fund which it possesses. It is a question whether, in those circumstances, an appeal to increase this Fund should not be made

to the public, who are in ignorance of what is being done, and who are, besides, little aware of the importance of providing for all private patients, who can only pay low rates of board, in public instead of in private Asylums."

"The structural changes in the East House are approaching completion. They are of a most satisfactory character, and will, no doubt, add as much to the prosperity as to the usefulness of the Asylum. The changes in the West House, which are also far advanced, cannot be spoken of in less commendatory terms. They have been well considered and executed, and their effect will certainly be highly beneficial to the patients."

"It is almost unnecessary to say, in concluding this Report, that the impression left by the visit, as to the management of the Asylum and the treatment of the patients, was in a very high degree favourable."

The Annual Report of the Charity Committee is herewith presented, and the Managers take the opportunity of pressing the claims of this Fund upon the attention of the benevolent. Looking to the large amount of debt presently owing by the Corporation, the Managers regret that they cannot advise any contribution from the general funds of the Institution to the Charity Fund for the past year.

(Signed) DAVID J. BRAKENRIDGE.

PHYSICIAN-SUPERINTENDENT'S ANNUAL REPORT

FOR THE YEAR 1876.

I have the honour to submit the following Report of the Royal Edinburgh Asylum for the Insane for the year 1876.

In the beginning of the year there were 709 patients in the Asylum, and on the 31st of December the number was 726.

There were 360 patients admitted during the year, of whom 180 were men, and 180 women.

The total number of patients under treatment during the year was therefore 1076.

There were 260 patients discharged during the year, of whom 146 were men, and 114 women.

There were 82 deaths, of whom 39 were men, and 43 women.

The average number of patients resident during the year was 740, viz., 352 men, and 388 women.

ADMISSIONS.

The number of patients admitted (360) this year has been considerably the largest in the history of the institution, and an increase has taken place in both the private and rate-paid classes of patients. A comparison of the admissions of each class, however, shows that, while the number of private patients admitted was 50 per cent. above the average of the last three years, the number of paupers had only increased by 13 per cent. The actual number of the former was 125, and of the latter 235. The Report of the Commissioners in Lunacy for Scotland shows that during the last ten years the average number of private patients placed in Scotch Asylums each year is a little less than one-third of the paupers,

while in the case of this Asylum we had during 1876 more than one private patient for every two of the other class. was our proportion of private patients admitted during the year thus greater than the average proportion for Scotland as compared with the rate-supported class; but if we compare the number of private patients resident here at the end of the year with the number of paupers, it is seen that, while we have 235 to 491, or about one to two, the proportion in Scotland generally at the end of 1875 was 1287 to 5274, or one to four. The institution, therefore, provides accommodation and treatment for private patients in double the proportion it does for paupers taking into consideration the number of each class in Scotland. In fact, one-fourth of all the private patients in Scotland sent to Asylums each year are sent here, while only one-eighth of the rate-supported class are In the case of the latter, we receive all the patients from Edinburgh, Leith, and Orkney, and no more; in the case of the private class, we receive all those who are sent to us from any part of the world.

One reason why the number of admissions of private patients exceeds that of previous years is, no doubt, the fact, that our new wings at the East House were finished and occupied during the year, so that I had not to refuse admission to so many patients who could pay the higher rates of board, as had been the case in former years.

Of the private patients, 140 pay the intermediate and lower rates of board. There is no doubt that this is probably the most philanthropic department of the institution. The law makes stringent provision for the accommodation of the insane poor. If we did not provide accommodation for them, it would be at once provided out of the public rates. The class of patients, again, who can afford to pay the higher rates of board would soon find institutions, private or public, into which they could be received. But the intermediate classes have not as yet found in Scotland any places so good as the great chartered public Asylums; and ours provides for a larger number than any of the others. I trust that very soon, when some of our present heavy outlay is paid, we shall be able to do still more for this class of patients at

still lower rates of board than we charge at present. Few schemes would have more of real charity in them, or would be so potent for good, as one by which any person mentally afflicted could be able at once to receive suitable treatment in association with persons of his own rank of life for the payment of any sum he could afford, without going on the rates. If our Charity Fund was raised to such an amount that it would yield an income of a L.1000 a year, we should be able to take in fifty such patients at L.15 or L.20 a year, and provide them with suitable accommodation, food, I am satisfied, from my experience, that and medical treatment. the early treatment of a disease, which must be treated early in most cases to be treated effectually, would thus be provided for a class of persons in whom at present it is often too long delayed, on account of the want of means, and reluctance to apply to the It ought, in my opinion, to be one of the first parish authorities. aims of this institution to supply this want in the future, as it has done in the past, only more perfectly and more widely.

Only about one-half of the private patients came from Edinburgh (66 of the 125), the remainder coming from all over Scotland, England, and Ireland.

Turning now to the pauper patients, the chief fact about whose statistics, as distinguished from the private patients, is this, that they are all from a definite district year after year, and represent the production of lunacy in all but the better-off classes in that There were 235 in all, only 4 of whom were from parishes beyond our district (though 25 were afterwards made chargeable to other parishes, and transferred to other Asylums). We may regard the remaining 231 as the fresh production of pauper lunacy requiring Asylum treatment in Edinburgh, Leith, Portobello, and the Orkney Islands for this year. This is 17 cases more than last year, 55 more than the average of the five years 1869-73, and 97 more than the average of the five years preceding that, viz., 1864-68. This does seem at first a most alarming yearly increase of fresh cases in so short a time; but if the matter is considered, the shortness of the time altogether precludes the very idea of its being entirely due to a real increase of mental disease in the community. If insanity doubled itself every fifteen years, it would be a very

simple arithmetical problem to determine the question of how long any sanity would continue to exist. Without saying that there may not be some little real increase in certain forms of disease of the brain that affect the mind, I think the increase of cases sent to Asylums every year is due to many other causes, of which the following are the chief:—1. The importance of early and suitable treatment is now more recognised, our statistics showing that many more cases are now sent in at an early stage of the disease than formerly. 2. Short transient cases, especially those due to bouts of alcoholic excess, are now sent here in greater numbers than formerly. 3. Cases of slighter mental disturbance, the result of old age, of paralytic attacks, of bodily diseases affecting the brain, and of general breaking down of the bodily powers, that formerly would not have been reckoned as insanity at all, are now sent here to be nursed and cared for. 4. The country is richer, and the parochial officers hesitate much less about charging the rates with the cost of providing for an insane person in an Asylum. 5. The capitation grant of 4s. a patient from the imperial exchequer greatly aids the last reason. A distinguished writer on insanity has put this perhaps in rather a strong light when he said, "The Government has, in fact, said to parish officials, We will pay you a premium of 4s. a head on every pauper whom you can by hook or crook make out to be a lunatic, and send into the Asylum. And just as in olden times a reward of so much for each wolf's head led to the rapid extinction of wolves in England, so we may expect that this premium on lunacy will tend to diminish materially, and perhaps to render gradually extinct, the race of sane paupers in England." 6. The ideas of repulsion attaching to an Asylum formerly are now much less strong. 7. When it is becoming a general custom to send persons mentally affected to Asylums, the facilities for this being great, and the objections less, it is obviously much easier for the relatives to do this, and so get rid of the trouble of nursing and caring for the patient. 8. The present tendency of society is to be intolerant of mental peculiarities and idiosyncrasies. It will rather pay for their absence than see them in its midst.

The number of broken down cases sent here this year was more marked than had ever been the case before. This is best seen

from the fact, that in the returns of the bodily and mental condition of each patient which I make to the Commissioners in Lunacy within the first fortnight after admission, I find that in no less than 100 of the cases were serious bodily diseases mentioned as distinctly existing, in addition to the mental disease.

The question of sending a patient to an Asylum is undoubtedly a most difficult one to determine in very many cases. so many considerations—family, social, pecuniary, legal, and medical—that this is not wonderful. The medical profession, on which rests the chief responsibility, as a general rule, finds few more grave matters to decide than whether a man is to be kept at home or sent to an Asylum, in certain cases. And no definite rules can be laid down in regard to this matter by even those who know most about it. I am very far from saying that every person who manifests any derangement of mind should be removed to an Asylum. It is as much the duty of the relatives and medical attendant of a patient suffering from mental derangement to try every means for his recovery at home and out of an Asylum, while there is a fair chance of these means being effectual, as it is for them to lose no time in sending him away, when his life or his recovery is in danger through want of the special care and appliances which an Asylum alone provides. There are certain considerations for the determination of this question which common sense and medical experience equally approve of. If a patient refuses food, and this cannot be overcome at home, it is, above all things, necessary to send him to an Asylum before his strength gets so exhausted as to interfere with his recovery. The brain is far too delicate an organ to stand for long both over-action and There are certain most pitiable cases, where the love starvation. of life, that strongest instinct in man, is so entirely lost, nay, even where the craving for death is as strong as ever the desire to live was in any man, for whom no watching in a private house is at all sufficient, and who should therefore be at once sent to an institu-Where there is present any strong tendency to do harm to others, the same course must be adopted. Sometimes the two things are combined in the same patient; and we have those shocking stories of murder and suicide by the same person, the

murder being usually committed on those nearest and dearest to the unhappy person. Usually such cases occur when a man's brain has been upset by alcoholic poisoning, or when it has been exhausted by illness, over-work, sleeplessness, or worry, or when a woman, after confinement, or during nursing, has become upset mentally, and has lost the strongest instincts of her nature; not only forgetting her sucking child, but wishing to take away its life. No woman should be allowed the charge of her child who shows signs of becoming insane after confinement or during nursing. Most cases of the disease called General Paralysis require Asylum management, and the sooner the better for them. Where there are unfounded insane suspicions, or hatred of near relatives, the patient needs to be sent away from them, and where can a patient be sent to, if he is not rich, but to an Asylum? The mental disturbance that is sometimes caused by epileptic fits very often indeed requires Asylum treatment, because such patients are dangerous in the extreme; and in any kind of mental disturbance of the circumstances of the patient, are such, that they manifestly aggravate it; if no proper attendance, or nursing, or food, can be got at home; if the symptoms threaten to become chronic; if no impression is made on the symptoms by the treatment adopted, then there can be but little question, that in such circumstances Asylum treatment is needful. On the other hand, Asylum treatment is usually not needed in the mental disturbances following a drunken bout, or the transitory delirium seen in growing boys and girls, or the milder mental disturbances following childbirth, or in that occurring during nursing if plenty of food can be given and the children removed, or in the mere aggravated dotage of old age, or in hysterics, or climacteric disturbances of the milder type; and, in fact, in very many other cases where treatment can be adopted in time, and where the symptoms are mild and not dangerous. Our present facilities for travel and change of scene and fresh air are unmixed blessings in the early treatment of mental disorders, helping us to break up morbid ideas and associations before they have taken root, and to restore the normal working of the brain. Those good effects are a clear set-off to some of the evils of our modern restless life, and travelling is now so cheap that a working-man

can change his whole surroundings for a shilling. I have seen many a patient saved both from falling into insanity, and from being sent to an Asylum, after the first symptoms of the disease had appeared, by being sent away for a change. There are exceptions to all rules, however, and in some cases travel and bustle help to aggravate the symptoms.

The causes of the insanity in the cases admitted have not been this year of an unusual character. Intemperance stands, as it always does, at the head of the list of causes, and in nearly onefourth of all the cases was put down as having had more or less to do with the coming on of the mental disease. The habit of taking chloral in one case undoubtedly brought it on. It is satisfactory to find that this cause is so infrequent, for there is a prevailing idea that this drug is self-prescribed regularly in many cases. to the extreme danger to brain and mind, as well as to life, of such a practice, I have not the slightest doubt, from my own observation. Mental and moral causes are put down in 43 of the cases as the cause why the reason was upset. And as one looks over the list of these, and tries to realize the mental suffering in the five cases where grief alone, or in the 22 cases where domestic and business anxieties and afflictions produced at length mental disorder requiring Asylum treatment, one feels that there are unrecorded tragedies going on every day around us that would call forth the sympathy of all men, could they be fully known. characterised by depression of mind were exceedingly common this year, no less than 118 of the patients suffering from Melancholia, and 95 had threatened or attempted to take away their own lives.

There is a well known tendency, at the beginning of an attack of insanity, for the delusions of the patient to be influenced by the public events of the time, or by any sensational news of the day. Just after news of two of the murders of the year had appeared in the papers, we had two patients sent here who had given themselves up to the police as the murderers. One case happened while the notorious Glasgow murderer Barr was at large, and while exciting details of how he was being tracked were appearing day by day in the papers. A poor man who, up to that time, had

been a most steady hard-working tradesman, and whom his wife says she never suspected of mental disturbance, left his work for dinner, and went quietly up to the Police Office, delivering himself up as the murderer Barr. The tragedy seemed to have so excited his nerves, that an attack of incurable insanity which, I have no doubt, was then coming on in him, was precipitated and probably aggravated by it. Another of my patients, just before admission, somewhat staggered a bank clerk in an English town, by presenting a cheque in due form for £120,000,000, and demanding instant payment.

DISCHARGES.

Of the total number of 260 patients discharged, 160 were recovered. This is the largest number of recoveries we have ever had, though the per centage on admissions $(44\frac{1}{2})$ is not the largest. In 85, or more than one-half of all those who recovered, the patients had been sent into the Asylum within a month of the coming on of the attack, and about one-half of them got over their malady within three months, while only 28 recovered after it had existed for periods over a year.

DEATHS.

The rate of mortality has been somewhat high this year, being 11 per cent. on the average numbers resident, $7\frac{1}{2}$ per cent. on the total numbers under treatment, and $22\frac{1}{2}$ on the number of admissions. This is slightly above our own average rate (the excess being 1.7, .7, and 1.5 on average numbers, total numbers, and admissions respectively), and that of the Asylums of Scotland during the past ten years. Nothing calls for greater vigilance on the part of its medical officer than a scrutiny of the death-rate of any institution at the end of each year. He should look on every death as a discredit to himself, and an affront to his profession. He should trace out the causes of each, remote and near, and not rest satisfied till he can discover good evidence that there are no preventible conditions that in any one case have tended towards death.

Going on those principles, I have gone carefully over the list

of our 82 deaths individually, and have also, by a comparison of their ages, diseases, and time of residence here, endeavoured to discover why we had more than usual this year. In regard to the ages of the patients, I don't find that the average age at death (50) or the number of individuals over 60 (17), was greater than in other years. Looking at the list of diseases which caused death (Table V.), almost all of which are ascertained by post mortem examinations, I do not find any epidemic form at all; and there is no single cause standing out very prominently except one, and that is General Paralysis, which carried off 22 cases instead of the usual average of 11. Now this, at all events, cannot be put down to any unhygienic or unfavourable conditions in the institution, for it was precisely because all those 22 patients had this dreadful disease that they were sent here at first; and, as yet, no remedy has been devised that has ever proved successful in any one case, or any means of mitigation of the slowly creeping palsy that seizes on every muscle of the body, destroying motion, abolishing speech, and soon extinguishing life. It is the one absolutely hopeless disease of Asylums, which, being once recognised, the patient's doom is held to be sealed, without a chance of respite. During its whole course, the treatment is attended with danger, anxiety, and trouble. The only good things about the disease are, that the patient is almost never conscious of his condition or his prospects, but is usually preternaturally happy and exalted, and that its duration seldom exceeds two or three years. It is a curious fact, that this disease was either not known or not recognised till about fifty years ago. It is now common enough in our city, our mining, and our manufacturing population, while it is still almost unknown in our entirely rural districts; and Irish Physicians tell us that in that country it is so exceedingly rare, as practically to be absent. Medical statistics say that it is proved to be increasing yearly in France, and there is but little doubt that it is increasing here too.

Heart diseases carried off 6 of the patients, which is an unusual number, 2 being the usual average. These, too, may be put down as inevitable, and the number accidental for this year. Inflammation of the lungs is the only preventible disease which stands

high, viz., 5 cases, in our list; but I find, on an examination of those cases, that four of the five had the disease on admission, and died at periods of from twelve to thirty-nine days after coming into the institution.

Apoplexy was unusually common (4 cases), and I need scarcely say that this was unpreventible. Consumption was less common (8 cases) than it used to be.

It is by an examination of the length of time the patients who died had been in the house before death, that most light is thrown on the mortality. I find that 42 out of the 82 died within six months of admission. Now, our admissions this year were unusually numerous, and, as I mentioned, 100 of them had distinct bodily diseases of a serious nature when they arrived. parison with the three previous years shows, that only an average of 20 patients died within the first six months of admission, so that the extra mortality of this year is seen to have taken place entirely among the patients who had been in the Asylum less than six months. This, taken along with the previous fact of so many of the new admissions of the year suffering from those serious bodily diseases, makes it quite certain that the explanation and cause of the excess of death of this year was the fact of the great number of patients admitted in such a condition, that they must die soon.

I find that 12 of the 22 cases of General Paralysis died within six months of admission, 4 of the 8 deaths from Consumption, 3 of the 6 from Heart Disease, and 2 of the 4 from Apoplexy within that time; showing clearly that this year we have not only had sent to us more than the usual number of cases with fatal diseases or their seeds, but that in many of these patients the diseases had advanced so far, or were so severe in their character, that death resulted very quickly.

It may seem unnecessary to have taken up so much time to discover the reason why our per centage of deaths was slightly over the average, but I am quite sure of the importance of a question of this kind.

A survey of the ages of the patients left in the Asylum at the end of the year is interesting, not only as bearing on the probable

future mortality in the institution, but also from a general point of view. We have only 10 inmates under twenty years of age, while we have no less than 126, or about one-sixth of our whole population, over 60. This is in very marked contrast indeed to the general population, where there is nearly one-half under 20, and less than one-twelfth part over 60 years of age. We have more persons over 70 than we have under 25.

GENERAL HISTORY OF THE INSTITUTION.

When an hospital for mental diseases has had within its walls in one year about 1100 patients of all classes, 360 of whom were new admissions, with the troubles and risks of the symptoms of recent insanity; when 160 patients have left it recovered, and 75 relieved of the worst symptoms of their malady; when there have been no preventible deaths, no epidemics, no suicides, and no accidents implying risk to the lives of patients or officials, I think it may be congratulated on having served the purposes for which it is provided fairly well. To be able to make such a record at the end of the year is the best reward for the troubles and responsibilities inevitable to the carrying on of its affairs, and is an encouragement to our officials to renewed exertion for the future.

Much progress has been made in the completion and occupation of the re-constructed wards for men in the West House. After completion otherwise, they were painted and papered in a tasteful and cheerful manner, and the new furniture got for them brought into use. Their general aspect is now exceedingly light and comfortable, and sanitarily they are also a great success, being easily warmed by the open fires, and yet not subject to get over-heated, like the old day-rooms. The great space allowed for the patients, too, prevents over-crowding at any one part, and so lessens the risk of collisions. Their large bow-windows, and the new plateglass in the windows at the end of the corridors, admit about four times as much light as formerly. The new lavatories and bathrooms answer their purpose admirably; and the water-closets, both in their arrangement and their position in the new towers projected from the building, with a cross current of air between

them and the wards, are all that could be desired. The addition of fire-places to all the dormitories has also been a very great comfort and improvement. The new dining-halls are now painted, and will be brought into use as soon as their furniture is ready. The new shoe-house, tool-houses, and sheds for the patients who go out to work on the farm, are also approaching completion.

In the East House the two new buildings, one for ladies, and the other for gentlemen, are now furnished and occupied. They have been painted and furnished elegantly and comfortably, having nothing about them to suggest confinement or gloom, and their general aspect is most home-like and bright. Already they are both about fully occupied. The new dining-rooms for the ladies and gentlemen are well under way, and will, I hope, soon be in occupation. The new kitchen-range, the cost of which was about L.400, has been an immense boon to the East House, the kitchen of which was formerly most inadequate, but is now equal to the demands on it. It will be no longer the fault of the kitchen, but of the cook, if the contentment that flows from a good dinner is not enjoyed by our East House ladies and gentlemen.

The high-walled airing-courts of the East House, and of the male division of the West House, have now been disused and abolished for over two years, and certainly with advantage. For the treatment of certain individual patients, as individuals, an enclosed space in the open air is useful; but it is better not to treat parties of patients in this way. They derive more benefit from walking or working in the open grounds. To occupy some of the worst class of men, we have been raising the level of the low ground near Myreside about three feet, with great advantage both to the ground and the patients. Work on the land, digging mother earth, is, after all, perhaps the simplest and most healthful toil for restoring the tone to exhausted human brains. It is, at all events, the most accessible way of going back to nature for I set a party of gentlemen to work in that restorative work. way in a retired corner of orchard with markedly good results to their health; but unfortunately a man who is in the position of a gentleman can seldom be got to do a thing so good for him.

wits must be far gone before he will do it; and the moment they come back again, his prejudices also return.

I endeavour to allow as much liberty to the patients as each one can use properly. The deprivation of liberty, though necessary at first in most cases of mental disease, is undoubtedly very hard to bear, and in many cases itself acts as a cause of increasing some of the nervous symptoms of the patient. Our sea-side house, at which one-half of our East House ladies and gentlemen, as well as some of the inmates of the West House, spent about a month each, did very great good to many of them, gave enjoyment to all, and was altogether a success this year. Many of those who cannot be trusted here enjoyed the fullest liberty there with the best results.

In the cases of some patients, I think that a thorough change at a certain stage of recovery is most beneficial, and completes the cure, when nothing else would. It is a great pity that a ready transference of patients from one public Asylum to another for this purpose could not be more easily effected than is the case at present. I have often heard of sudden improvement in chronic lingering cases through removal to another institution, and have observed the same result to follow the transference here of such cases from other institutions.

The position of our attendants has been in many respects improved, but still the best of them are underpaid. Their duties are trying and irksome, and to do them well requires the exercise of some of the best qualities of human nature. I am sure that the Managers will see it to be their interest to go on making their position and that of all the resident officials as comfortable as they can. It would be a great gain if we had a few more houses for married attendants.

During the year the institution suffered the loss of the services of Dr Maclaren, who had been for three years a most zealous and able Assistant Physician, and who received the well-earned promotion to the Superintendency of the Stirling District Asylum. The Medical Staff perform their duties in all respects satisfactorily. The Rev. Mr M'Culloch, Mr Leslie, Miss Shearer, and Mrs Macdougall, co-operate with me in their several departments most

heartily. Of Messrs Gray, Gregory, Lindors, and Crombie, I cannot speak too highly; while Miss Massey, the new head female attendant, justifies her promotion by her efficiency.

In conclusion, let me thank the Managers, and more especially those of them who have served on the Visiting Committee, for their consideration, help, and support during the year.

> T. S. CLOUSTON, M.D., F.R.C.P., Physician-Superintendent.

REPORTS

OF THE

COMMISSIONERS IN LUNACY.

ROYAL EDINBURGH ASYLUM, 14th, 15th, and 16th March 1876.

The number of patients at present on the Asylum registers is as follows:—

		Males.	Females.	Total.
In East House	• • •	 41	39	80
In West House	• • •	 309	338	647
On Pass	• • •	 1	1	2
On Probation	• • •	 3	1	4
				-
	Total	 354	379	733

Since the date of last visit the following changes have taken place:—

		Private.		Pau	per.	
		M_{\bullet}	F.	\mathbf{M}_{ullet}	\mathbf{F}_{ullet}	T_{\bullet}
Admissions	• • •	25	11	31	28	95
Discharges	• • •	8	14	22	29	73
,, Recovered		7	8	18	22	55
Deaths	• • •	6	2	4	9	21

Three voluntary patients are included in the admissions, and one is included in the discharges.

Of the patients discharged, 3 men and 6 women were transferred to other Asylums, leaving no fewer than 27 men and 37 women who were transferred to private care.

The mortality has not been high, and the existing health condition is good. Phthis appears of late to have been less frequently a cause of death than it was formerly. In nearly every case of death a post mortem examination has been made.

There are only 4 entries in the Register of Restraint and Seclu-

sion. They refer to the seclusion of 4 patients for periods varying from five to six hours.

Five accidents are recorded. Three of them were trifling. Two were burns of some severity. No patient was found wearing any special contrivance of dress.

The number of patients usefully employed is considerably increased. This is as apparent among the women as among the men. As regards the out-door workers, there is not only an increase of their number, but they show a greater interest and activity in their occupations.

In consequence of the extensive structural changes which the Asylum is undergoing, it has been for nearly six months practically without walled airing-courts. This has not led to any increase in the number of escapes or accidents, nor has it rendered the management more difficult. There is less lounging, but there is no reduction of the amount of active open-air exercise.

Visitors to patients are very numerous, and interviews are nearly always allowed.

Many patients are on parole, both beyond and in the grounds. Absences from the Asylum on pass for periods of more than one day are frequent. During 1875, 64 patients were thus allowed to visit their friends, and the whole number of days of absence was 923, or about a fortnight each. This is exclusive of the summer change to North Berwick, in which 31 patients participated—the average stay of each patient being five weeks.

Unusual quiet and contentment prevailed among the patients, and scarcely any complaints were made.

Enough has now been done in carrying out the structural changes to make it possible to realise the thoroughness of their character, and to see how much they will add to the well-being of the patients, and the efficiency of the Institution as an hospital for the care and treatment of the Insane.

It is not so well known as it should be that in this Asylum there are not a few unfortunate persons belonging to the educated classes who are either actually paupers or pay a pauper rate of board, but who are treated as private patients, and are brought into association with those in their own rank of life. It would be difficult to over-estimate the beneficence of this; and it is to be wished that the charitable public would put the Directors in a position to extend this blessing to a larger number.

In the treatment and management of the patients, many things were seen which indicated that the condition of each patient had been carefully and minutely studied both by the Physician and the Assistant-Physicians.

The Books and Registers were, as usual, found in excellent order.

ARTHUR MITCHELL, Commissioner in Lunacy.

Edinburgh Royal Asylum, November 15, 1876.

The following are the changes which have taken place among the patients since the visit of 16th March:—

		\Pr	ivate.	Pau	iper.	
		Males.	Females.	Males.	Females.	Total.
Admissions		39	43	80	89	251
Discharges	• • •	28	20	59	58	165
Deaths		11	15	14	18	58

These figures show an increase of 32 in the numbers on the Registers. Of voluntary inmates there have been 1 admission and 4 discharges. Of the numbers at present on the Registers, 87 are resident in the East Division, and 661 in the West Division; 1 is absent on pass; 2 have escaped; and 11 are absent on probation.

Of those discharged, 114 had recovered, 39 were relieved, and 12 were not improved. Of the non-recovered, 24 were transferred to other Institutions.

Of the 58 patients who died, 45 were admitted in 1874, 75, and 76, and the rest in earlier years. The main causes of death were consumption and chronic affections of the nervous centres; the former accounting for 8, and the latter for 29, of the fatal cases.

The transition state in which the establishment was found at the last three visits still continues; but in the East Division the new wings in the rear of the original buildings have been completed, and are being taken into occupation. The accommodation they furnish is of a most comfortable description, and will afford the means of conducting the treatment of the patients in a much more satis-

factory manner than has hitherto been possible. The furniture and fittings are such as are seen in the best appointed private dwellings, and nothing presents itself which could be set down as characteristic of an Asylum. In the main building many improvements have been already effected, and others are in process of being carried out. The old airing-courts are being converted into open flower-gardens; and altogether the establishment, both within and without, is being brought into accordance with the most advanced views of the day.

In the West Division considerable progress has been made in the radical changes which have been there undertaken, and the result is exceedingly satisfactory. But the full advantage of them will not appear until the new dining-hall has been taken into occupation, and until the disturbing influence of extensive operations in wards all having their full complement of patients, comes to an end.

Making due allowance for the confusion which is thus necessarily produced, the condition of the establishment must be regarded as very satisfactory. No patient was found in seclusion; and from the Registers it appears that only on seven occasions, and in the cases of four individuals, has seclusion been had recourse to since last inspection. In one case restraint by the polka has been occasionally required. Owing to the inclement state of the weather, exercise out-of-doors has recently been much restricted; and on this account some of the females were inclined to be noisy. large proportion of them, however, were industrially employed; and the arrangements recently made for the classification of the female patients, are regarded as giving very satisfactory results. The recent cases are thereby brought under more constant and more efficient observation; and from being at once associated with industrial patients, they are more readily led to engage in work than when they were less concentrated. Altogether 214 female patients are registered as industrially employed. Of the men, 238 are workers; and of these 163 are gardeners and labourers, and about 30 artizans. The new workshops for the tailors and shoemakers are large, well-lighted, and well-ventilated.

In connection with the structural alterations, the walls of several of the airing-courts have been taken down, and extended exercise

in the general grounds is now the general rule. So far from any evil effects having been experienced from the want of airing-courts, their abolition is regarded as having had a very beneficial influence on the community. Liberty on parole is extensively granted, and many patients are allowed to be absent for several days "on pass." During the summer a house was rented by the sea-side, and in this way 13 males and 24 females had the benefit of change for an average period each of 33 days. These details are given as indicating the spirit in which the establishment is conducted.

The bedding and day-clothing were in a satisfactory state; and the use of hair mattresses will soon be universal, except for the patients who are habitually wet. The number of broken-down decayed cases is at present unusually large, partly from the progress of age and disease in those patients who have been long resident, and partly from the increasing practice of making the Asylum a receptacle for old persons, who, from irritability or the decay of their faculties, have become troublesome at home.

The various Registers are neatly and carefully kept. Altogether the impressions produced by the visit were very gratifying, and the future of the establishment is regarded with confidence.

JAMES COXE, Commissioner in Lunacy.

ROYAL EDINBURGH ASYLUM, 30th and 31st January, and 1st February 1877.

The following statement shows the number of patients at present on the Registers:—

_		Males.	Females.	Total.
In the East Division	•••	47	47	94
In the West Division	•••	295	350	645
${ m Resident}$	• • •	342	39 7	739
On Pass	• • •	2	0	2
On Probation	•••	1	6	7
On the Registers	• • •	345	403	748

In these numbers two voluntary patients are included.

The changes which have taken place since the date of last visit are as follows:—

		Private	Patients.	Pauper	Patients.			
		Males.	Females.	Males.	Females.	Total.		
Admissions	•••	16	9	32	29	86		
Discharges	•••	5	10	49	21	85		
Deaths	•••	3	1	8	3	15		

These figures indicate a large and active movement in the population. The number of admissions has been very great, being 36 for the month of January, and about one daily for the whole of the year 1876. Among those admitted there have been many in a very feeble and broken down condition of health. In view of these facts, the mortality must be regarded as low. As causes of death, General Paralysis appears with increasing, and Phthisis with decreasing, frequency. The average age at death was about 54. The medical treatment of the patients continues to be conducted in a painstaking and efficient manner, and the Case Books are very satisfactorily kept. In nearly every instance of death, a post mortem examination is made, and the results are carefully recorded.

Of the 85 patients discharged, 37 were recovered, 35 relieved, and 13 not improved. The numbers of the relieved and unimproved include 38 patients transferred to other Institutions or to Ireland. The large number of transferences is due to the opening of wards for male lunatics in the Edinburgh City Poorhouse.

On the 1st of January 1877 the population was made up of the following elements:—

1.	Pauper Lunatics	chargeal	ole to t	the Edi	nburgh	Distric	\mathbf{t}
	and Orkney	•••	•••	•••	•••	•••	467
2.	Pauper Lunatics	chargeal	le to th	he Pari	shes be	yond the	Э
	District	•••	•••	•••	•••	•••	20
3.	Private Patients	•••	•••	•••	•••	•••	239
					Total	•••	726

It thus appears that this Asylum gives accommodation to a very large number of private patients. Many of these pay high rates of board, and they have comforts and advantages in return such as few Asylums supply. A large proportion of the private

patients, however, pay low rates of board; and in reference to them, it is felt that this Institution discharges a very humane and charitable function. They are most liberally treated, and to their history and habits a very kindly consideration is given. The same liberal dealing is extended to some patients who are actually paupers, but who belong socially to a class above that from which pauper lunatics are ordinarily drawn. In carrying out these benevolent objects, the Institution must frequently suffer a loss far beyond any possibility of recoupment from the small Charitable Fund which it possesses. It is a question whether, in these circumstances, an appeal to increase this fund should not be made to the public, who are in ignorance of what is being done, and who are besides little aware of the importance of providing for all private patients, who can only pay low rates of board, in public instead of in private Asylums.

Only two accidents are recorded—a fracture of the bones of the arm, and a dislocation of a rib from its cartilage. There is good reason, however, to doubt whether the last accident really occurred after the patient's admission.

The Register of Restraint and Seclusion for the East Division contains no entry, and that for the West Division only seven entries, referring to four patients. At the time of the visit only one patient was found wearing any special contrivance of dress.

Notwithstanding the taking down of the airing-court walls, the greater occupation of the men out of doors, the increased liberty accorded to the patients, and the confusion attending the extensive building operations, there has been no increase of the number of escapes. Passes are frequently given to the patients, who are thus enabled to visit their friends in town, unaccompanied by attendants. In the case of convalescents this is often productive of much benefit; but it adds also to the contentment of many whose lunacy is confirmed, but who are trustworthy and capable of appreciating such a privilege.

The industrial occupation of the patients has undergone further extension, but it is thought that a still larger number of the women might with advantage be usefully employed.

The structural changes in the East House are approaching completion. They are of a most satisfactory character, and will;

no doubt, add as much to the prosperity as to the usefulness of the Asylum. The changes in the West House, which are also far advanced, cannot be spoken of in less commendatory terms. They have been well considered and executed, and their effect will certainly be highly beneficial to the patients.

It is a question whether some new arrangement in regard to the Infirmary wards, both for men and women, is not desirable. The wards at present in use for the sick are too small, and it is suggested that the propriety of converting into an Infirmary the whole one story block, hitherto known under the objectionable name of the Separate Wards, should be taken into consideration. It would not be difficult to convert these buildings into an admirable hospital; and if their accommodation is somewhat in excess of what would be needed for the more actively sick, that would scarcely be a fault, as it could easily and advantageously be occupied by suitable patients chosen from the other wards of the Asylum. It is believed, however, that the number of strictly proper occupants of a sick ward would be found to increase, if the accommodation of that ward were greater.

The Books and Registers were, as usual, in excellent order.

It is almost unnecessary to say, in concluding this Report, that the impression left by the visit, as to the management of the Asylum and the treatment of the patients, was in a very high degree favourable.

ARTHUR MITCHELL, Commissioner in Lunacy.
